

Amendments to the Specification

Please replace paragraph [0017] with the following amended paragraph:

The distance index described in the present invention avoids these pitfalls. First, by using resident-level case data the resulting index differentiates accurately between different locales within a county. Only two variables are required for each locale, one from each of the two following categories:

- P: county population, or county population density.
- D: distance in miles or kilometers, or distance in elapsed-minutes.

Please replace the objected-to equation in paragraph [0019] with the following amended equation:

$$\text{sign}(\lambda_j) = \begin{cases} +1 & \text{if } \lambda_j \geq 0 \\ -1 & \text{otherwise} \end{cases}$$

Please replace the objected-to equation in paragraph [0039] with the following amended equation:

$$E(\varepsilon_{jt} \cdot \varepsilon_{js}) = \Omega_{jt} \text{ and } E(\varepsilon_{jt} \cdot \varepsilon_{js}) = 0 \text{ for } t \neq s.$$

Please replace paragraph [0047] with the following amended paragraph:
